Overview

Simple Music Player is an extension of Unity's audio source component, adding simple out of the box music controls and saving time!

RATE

If you enjoyed this asset, please rate it! It will help alot! Furthermore if your having issues or need improvements reach out to hunter.glen@gmail.com

QUICK SETUP VIDEO

- <https://youtu.be/JHa0bL5ZbhA>

SCENES

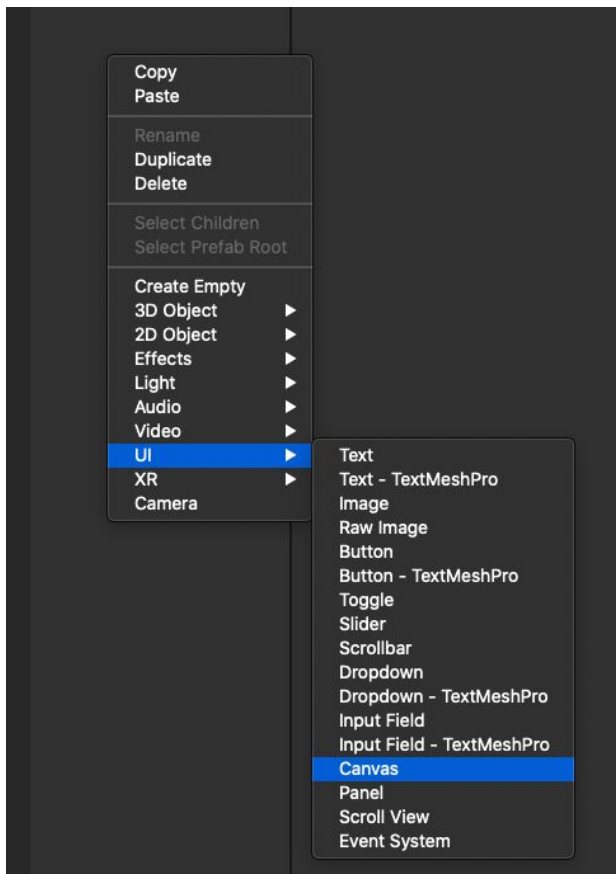

- Music Player Portrait
- Music Player Landscape

MAIN PREFABS

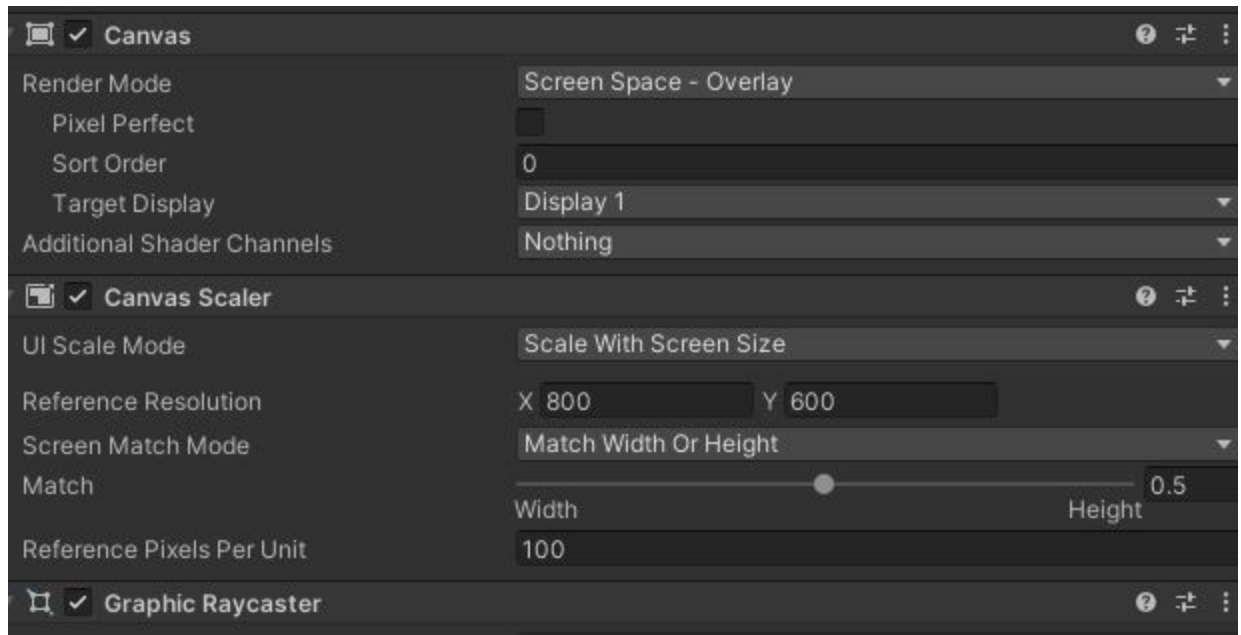

- Music Player (Portrait)
- Music Player (Landscape)

SETUP

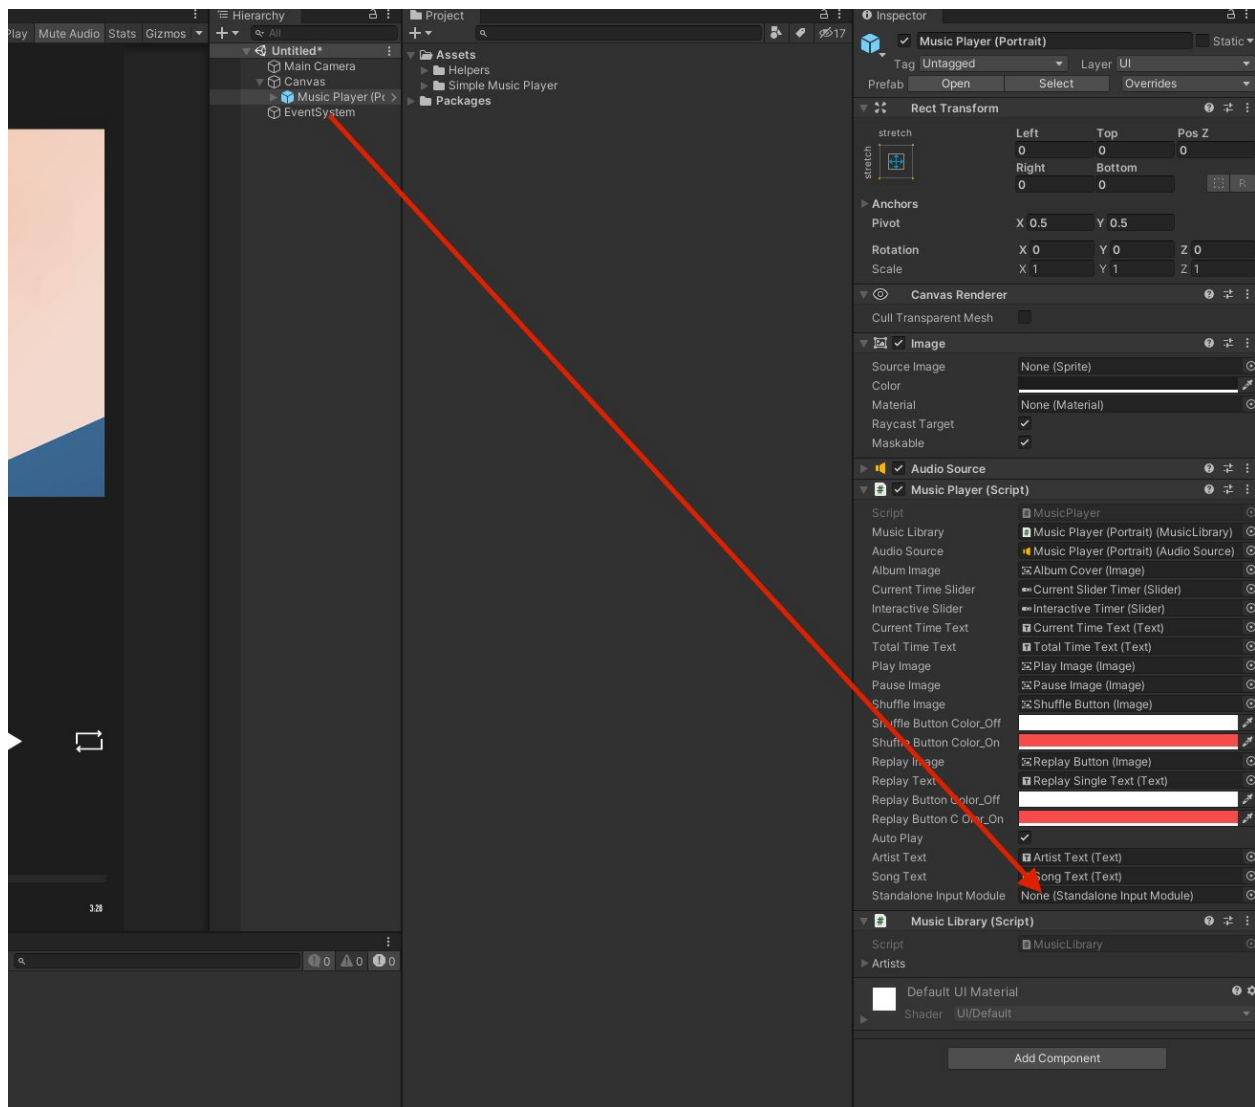

1. Create a new scene
2. Add a Unity Canvas component/gameobject into the scene. Doing so by right clicking in the hierarchy > UI > Canvas

3. Setup canvas to your liking, in this case asset was developed using the following values (see picture below)

4. Drag and drop either [Music Player \(Portrait\)](#) or [Music Player \(Landscape\)](#) prefab located in the Simple Music Player > Prefabs project folders into your scene/hierarchy as a child object of the previously created canvas object.
5. Select Music Player prefab then drag and drop EventSystem gameobject into the Music Player scripts empty Standalone Input Module, within the inspector window. (See image below)

6. Hit play and listen to music! :)

ADDITIONAL THINGS TO NOTE

ADDING SONGS / SETTING UP MUSIC LIBRARY

On the Music Player gameobject within the inspector window, you can find the Music Library script. Here within, you can add an Artist, under each artist, you can add the name of the artist and add albums, under each album you can name the album name, sprite and the songs which will be used.

CHANGING COLORS

Changing the colors of the Music Player for the most part can be manually for example selecting the gameobject with the scene however the shuffle button and the replay buttons have a toggle highlight. The color for these buttons can be modified in the Music Player gameobject/script within the inspector window.

LOADING ALBUMS/SONGS/PLAY

MusicPlayer.cs has a reference to MusicLibrary.cs where a list of Artist/Albums are contained. Three main methods within MusicPlayer.cs LoadAlbum(int artistId, int albumId), LoadSong(int songIndex) and Play(); The parameters uses the indexing of MusicLibrary.Artists List

In order for the method Play() to be called within MusicPlayer.cs, LoadSong() and LoadAlbum() must be called first.

AUTOPLAY TOGGLE

The autoplay toggle, when checked enables the next song to play automatically when the current song has ended. You can toggle autoplay within the Music Players gameobject/script inspector window.

REPLAY BUTTON

The replay has three different states that cycle, depending on the amount of times clicked in runtime. These are, no repeat, repeat all and repeat single.

- No repeat = songs will not be repeated or the playlist/album won't be repeated when the user reaches the end of the playlist/album
- Repeat all = when checked and playlist/album is complete the next song to be played will be the first song in the album, which if autoplay is checked. Will play automatically
- Repeat single - repeats the current song after the current song has ended or when the user attempts to skip to another song

NOTE: If the shuffle button is selected play and repeat single is 'already' selected repeat single state will change to no repeat.

The color for this button can be modified on the Music Player gameobject/script within the inspector window.

SHUFFLE BUTTON

The shuffle button when enabled, randomises the next song that is played.

NOTE: If the shuffle button is selected and the repeat button is highlighting that it's in the 'repeat single' state. The replay button will return to 'no repeat' state.

The color for this button can be modified on the Music Player gameobject/script within the inspector window.

SCRUBBAR

NOTE: there are two sliders (Current Slider Timer & Interactive Timer) if editing direct properties other than the colors for example the size of the handle, the changes have to be applied to both.

Current Slider Timer - Uses a visual slider, to visually show the current track position.

Interactive Slider Timer - Receives input from the user, to update the current track/song position, using a Unity slider component and drag and OnPointer events to update.

EVENT SYSTEM - STANDALONE INPUT MODULE

Is required for the scrubbar, this is because there's a use case for when DeactivateModule() which gives easy accessibility to ClearSelection()

<https://docs.unity3d.com/2018.3/Documentation/ScriptReference/EventSystems.PointerInputModule.ClearSelection.html>. ClearSelection() Clear all pointers and deselect any selected objects in the [EventSystem](#).
